Abstract

This dataset is the major released version of the annually released meshblock boundaries as at 1 January 2018, clipped to the coastline. Stats NZ maintains an annual meshblock geography for collecting and producing statistical data. This allows data to be compared over time. A meshblock is the smallest geographic unit for which statistical data is collected and processed by Stats NZ. A meshblock is defined by a geographic area, which can vary in size from part of a city block to a

large area of rural land. Each meshblock borders on another to form a network covering all of New Zealand, including coasts and inlets and extending out to the 200-mile economic zone. Meshblocks are added together to build up larger geographic areas such as statistical area 1 (SA1), statistical area 2 (SA2), and urban rural. They are also used to define electoral districts, territorial authorities, and regional councils. There are two ways of amending meshblock boundaries. Splitting is subdividing a meshblock into two or more meshblocks. Nudging is shifting a boundary to a more appropriate position. Reasons for splits and nudges include: to accommodate changes to local government boundaries, which are required by the Local Government Act 2002 to follow meshblocks for electoral purposes to accommodate changes to parliamentary electoral boundaries, following each Electoral Representation Commission review after each five-yearly Census of Population and Dwellings to make changes to statistical boundaries such as statistical area 1 (SA1), statistical area 2 (SA2), and urban rural to enable changes to census collection districts to improve the size balance of meshblocks in areas where there has been population growth to separate land and water – e.g. mainland, islands, inlets, and oceanic are defined separately to accommodate requests from other users of the meshblock pattern e.g. NZ Police for their station, area, and district boundaries.

Meshblock numbering process until 2014 (MB 2014) Meshblocks were allocated a unique seven-digit number. The first five digits were unique, and referred to the original 1976 meshblock code. The two end numbers referred to sequential meshblock splits to the original meshblock. When a meshblock was split the final two digits of the original meshblock number were changed. Stats NZ maintains a concordance file to ensure that boundaries relating to earlier meshblock patterns can also be produced.

Meshblock numbering process from 2015 (MB 2015) Due to new technology being introduced for splitting and nudging meshblocks, the process for allocating a unique seven-digit number has changed. New meshblock numbering is approximately sequential. The first meshblock number in this new sequential numbering pattern is 4000000. This differentiates meshblocks split from MB2015 onwards, and allows for a large number of unique seven digit identifiers to be allocated. Now when a meshblock is split it takes on the next available number, rather than following the former process described above. For example, a meshblock numbered 3254000 is split into two meshblocks. Using the new numbering process the system will assign the first available sequential numbers. The following table shows how the two meshblocks would be numbered based on the old and new processes.

Original meshblock	Old numbering	Original meshblock	New numbering
3254000	3254001	3254000	4000000
		3254002	4000001

The digital geographic boundaries are defined and maintained by Stats NZ. Meshblocks cover the land area of New Zealand, the water area to the 12-mile limit, the Chatham Islands, Kermadec Islands, sub-Antarctic islands, off-shore oil rigs, and Ross Dependency. The following 16 meshblocks are not held in digitised form.

Meshblock	Location (statistical area 2 name)
0016901	Oceanic Kermadec Islands
0016902	Kermadec Islands
1588000	Oceanic Oil Rig
Taranaki3166401	Oceanic Campbell Island
3166402	Campbell Island
3166600	Oceanic Oil Rig
Southland3166710	Oceanic Auckland Islands
3166711	Auckland Islands
3195000	Ross Dependency
3196001	New Zealand Economic Zone
3196002	Oceanic Bounty Islands
3196003	Bounty Islands
3196004	Oceanic Snares Islands
3196005	Snares Island
3196006	Oceanic Antipodes

Islands3196007Antipodes IslandsMeshblock boundaries generally follow road centre-lines, cadastral property boundaries or topographical features (e.g.rivers). Expanses of water in the form of lakes and inlets are defined separately from land.The annual pattern of digital boundaries is used for the full calendar year from 1 January.Digital boundary data became freely available on 1 July 2007.

Purpose

MB2018_V1_00_Clippered is a major released version of the annually released meshblock boundaries as at 1 January 2018, clipped to the coastline. This clipped version has been created for map creation/cartographic purposes and so does not fully represent the official full extent boundaries. This version contains 52,923 meshblocks.

Statement

The digital meshblock boundaries are stored and maintained by Stats NZ. Non-alignment of meshblock and cadastral boundaries are one of a number of reasons for meshblock boundary adjustments. Other reasons include requests from local authorities, Local Government Commission, Electoral Representation Commission and to make census enumeration processes easier. From the generalised meshblock pattern, higher geographies are dissolved using the dissolve tool in the Arc GIS suite to create multiple output datasets. To derive the meshblock boundaries clipped to the coastline, meshblock polygons were dissolved to exclude meshblocks with a land/water attribute of Inlet or Oceanic.
